The intimacy that we used to have went away. All of a sudden, it was like we were completely separated. There was no connection.

WHAT ARE MY TREATMENT OPTIONS?5

Whatever is causing your ED, there is a treatment option that can provide a satisfying solution. Oral medications are a common first step, but they don’t work for everyone or may stop working.

Other treatments include vacuum erection devices, injections and intraurethral suppositories. A penile implant is designed to be a permanent solution for men suffering from ED and can provide an erection whenever and wherever desired.

AMS 700™ Penile Implant

An inflatable penile implant like the AMS 700 Penile Implant may be the best treatment option for men with erectile dysfunction. A penile implant is a device that is implanted into the penis, usually on an outpatient basis. The implant is entirely concealed within the body so no one is able to see it and is controlled by the user to achieve an erection. This treatment is designed to allow for spontaneity and the erection is maintained for as long as the man desires.

Penile implants have been in clinical use for over 40 years6 and nearly 500,000 men have received a Boston Scientific penile implant.7

"For me, it’s very exciting. Once he has an ejaculation, the erection is still there. We can be intimate for as long as I want, which is very satisfying for me." — Linda

AMS 700™ Penile Implant most closely mimics a natural erection, providing rigidity when inflated and a natural, flaccid appearance when deflated.

- Designed to be a permanent solution for ED
- Spontaneous — you can have sex when the mood strikes
- Once activated, the erection can last as long as you desire
- Entirely contained inside the body — no one knows you have an implant unless you tell them
- Designed to feel natural during intercourse and typically does not interfere with ejaculation or orgasm8
- Broad range of lengths available for a custom fit, depending on your anatomy
- Cylinders that expand in length and girth
- Pre-treated with antibiotics to reduce the risk of infection

With a penile implant, the possibility of organic erections or alternative treatment options for ED are eliminated. Possible risks of a penile implant include: mechanical failure of the device, which may require revision surgery; and upon removal or replacement of the implant, the penis may become scarred, shorter or curved. Pain associated with the healing process can be expected. With the procedure, there is a risk of infection (1-2.5% risk with the AMS penile implant10) and men with diabetes, spinal cord injuries or open sores may have an increased risk of infection.

Talk to your doctor for a complete list of risks, warnings and safety information.
